

Interlocking  
Concrete Pavers  
& Permeable  
Interlocking  
Concrete Pavers

# DURABILITY

Don't Compromise on Your Next Design

## Benefits

- Reduced pavement maintenance and replacement
- High density pavers resist deterioration by deicing salts
- Durable and superior physical properties of pavers provide longer pavement life

## Advantages

- In commercial or vehicular application, unit concrete pavers provide proven durability
- ICP and PICP are not subject to crumbling

## Solutions

**Tired of re-sealing blacktop parking lots or repairing spalling concrete?** Interlocking concrete pavers are the perfect solution, made to withstand harsh conditions and cold weather better than asphalt.

**Concerned about unsightly cracking of poured or stamped concrete?**

Concrete pavers have high compressive strength, low water absorption, and excellent freeze-thaw durability. And expansion joints are not needed in this pavement system.

**Interested in long-term durability?** What level of durability is needed in your design? Limit your exposure and don't risk a commercial design by specifying a pavement surface that does not have proven durability. Leverage the density and strength of concrete to ensure the longest design life possible.

**Is my pavement surface sturdy, skid resistant, and stable?** If you are looking for a surface that can handle pedestrian and vehicular traffic, then avoid the smooth, slick surfaces on other materials. Go with interlocking concrete pavers with chamfers offering unique macro-texture that benefits skid resistance and can reduce braking distances. Chamfers also help channel water away from the pavement surface. Bottom line: concrete pavers increase safety due to their slip and skid resistance characteristics.

**What is the life expectancy of my interlocking concrete pavement?** Conventional pavement design life is typically 20 to 25 years, and traditional asphalt pavement requires regular resurfacing. The use of interlocking concrete pavers can meet or exceed conventional pavement design criteria. Eliminating re-surfacing costs improves the life cycle cost of the pavement.

**What about repairs?**

Interlocking concrete pavers are designed to be removed, replaced, or reused. Utility repairs are made easy with a flexible pavement system, and best of all, the repaired area is ready for immediate use, no need to wait for in-place curing.

## Features

**Manufactured in accordance with ASTM or CSA standards before they arrive at the job site.** Concrete pavers are required to have a minimum average compressive strength of 8,000 psi. They must have maximum absorption of 5% and in cold climates they must meet freeze/thaw durability standards. There are other requirements addressing dimensional tolerance and minimum thickness. Get the test results up-front and rest assured the product is durable

and will perform as you designed.

**A variety of shapes, textures, and sizes are available.** Whether you're looking for symmetry, random patterns, or a unique design, utilizing concrete pavers gives you unlimited artistic license. And best of all, because they are pre-cast, pavers meet ASTM or CSA standards before installation.

**Different thicknesses for different applications.** This is important for vehicular or roadway applications, compared to plazas and walkways. Use the right concrete paver for the application.
